CD4; Complementarity determining regions; CDR; lateral domains; mimics; glycoproteins; Immunoglobulin superfamily; SLE; MS; RA; GVH; inhibit T cell proliferation; treatment of multiple sclerosis; systemic lupus erythematosus; graft rejection; rheumatoid arthritis; graft versus host disease; T cell leukaemias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from the high resolution crystal structure of human CD4 (Brookhaven code: 1CD4). The CDR regions were used for modelling peptide minics CD4: The CDR regions were used for modelling peptide minics or 90-92 (Lys Glu Glu) of CD4 and may comprise additional flanking sequences from CD4. This peptide comprises amino acids 90-93. The peptide minics are useful for inhibiting the proliferation of T cells modulating immune responses in mammals and may be used to treat, e.g. SLE, RA, MS, GVH, graft rejection and T cell leukaemias,
code: 1CD4). The CDR regions were used for modelling peptide mimics. CDR3 peptides comprise the essential amino acids 88-90 (Asp Gln Lys) or 90-92 (Lys Glu Glu) of CD4 and may comprise additional flanking sequences from CD4. This peptide comprises amino acids 89-92. The peptide mimics are useful for inhibiting the proliferation of T cells modulating immune responses in mammals and may be used to treat, e.g. SLE, RA, MS, GVH, graft rejection and T cell leukaemias,

```
The nucleotide and deduced aa sequences of human transducin-like enhancer of split proteins TLE-1 (AAG62175, AAR51476), TLE-2 (AAG62176, AAR51477), TLE-3 (AAG62177, AAR51478) and TLE-4 (AAG62178, AAR51479) were determined. The aa sequences were compared with that of Drosophila E(spl)m9/10 protein (AAR51481). Comparison of the WD-40 domains of these proteins defined the consensus residues shown in AAR51480. The antigen, human c-myc, human p53, human A-myb and dorsal proteins with respect to nuclear localization site, and casein-kinase II and cdc. kinase phosphorylation sites (sequences AAR51482-96). TLE can be used to treat or diagnose (pre)neoplastic conditions, or

This peptide is a specific example of a generic formula covering 2-amino-6,7-dihydroxy-4-thiaheptanoic acid derivs. bonded to a sequence of 1-10 amino acid residues, at least one of which has a water-solubility enhancing group. Such compounds improve the state of haematopoiesis-insufficiency and can be used for treating or preventing leukocytopaenia caused by radiotherapy or chemotherapy of cancers. They can also be used as haematopoietic stimulating agents in the case of bone marrow transplantation, as immunostimulating agents having leukocyte-increasing action; and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunostimulant; thrombocytopaenia; haematopoiesis insufficiency;

                                                                                                                                                                                                                     The nucleotide and deduced as sequences of human transducin-like enhancer of split proteins TLE-1 (AAQ45333, AAR51109), TLE-2 (AAQ45334, AAR51110), TLE-3 (AAQ45335, AAR51111) and TLE-4 (AAQ45336, AAR52953) were determined. The as sequences were compared with that of Drosophila E(spl) m9/10 (AAR52955). Comparison of the WD-40 domains of these proteins defined the consensus residues shown in AAR52954. The CCN motifs of the proteins were compared with those of SV40 T antigen, human c-myc, human B33, human A-myb and dorsal protein with respect to nuclear localization site, and casein-kinase and cd2-kinase phosphorylation sites (sequences AAR52956-70).

Sequence 1, Application US/09740359

Patent No. US20010041787A1

GENERAL INFORMATION:

APPLICANT: Kieldsen, Thomas Borglum

APPLICANT: Ludvigsen, Svend

TITLE OF INVENTION: Method for making insulin precursors and

TITLE OF INVENTION: Insulin precursor analogues having improved fermentation

TITLE OF INVENTION: 1 insulin precursor analogues having improved fermentation

TITLE OF INVENTION: 1 insulin precursor analogues having improved fermentation

TITLE OF INVENTION: 1 insulin precursor analogues having improved fermentation
